## RCM6700 Standard Development Kit (101-1327)

The standard development kit has the essentials that you need to jumpstart your evaluation and design efforts. The RCM6700 Standard Development Kit includes

- a complete Dynamic C software development system,
- the RCM6700 and
- a development board that will allow you to evaluate the RCM6700.

Digital I/O and serial accessory boards will help to illustrate the RCM6700 features by running the sample programs included with Dynamic C. You will also be able to write and test software for the RCM6700 modules, including Ethernet or TCP/IP applications.

Custom samples and ready libraries dramatically reduce development time from months to weeks. Programming is done in Dynamic C which is ANSI C compatible allowing for easier code porting from existing applications.

## RCM6700 Deluxe Development Kit (101-1326)

The Deluxe Development kit includes Digital I/O and Serial Communication accessory boards to help illustrate the RCM6700 features by running additional sample programs included with Dynamic C. You will also be able to write and test software for the RCM6700 modules, including Ethernet or TCP/IP applications.
